MILBEMAX™

MILBEMAX™ Tablets for Small Cats

(Each tablet contains 4 mg MILBEMYCIN OXIME and 10 mg PRAZIQUANTEL)

MILBEMAX™ Tablets for Cats

(Each tablet contains 16 mg MILBEMYCIN OXIME and 40 mg PRAZIQUANTEL)

MILBEMAX Tablets:

- Treat and control adult and immature roundworm (*Toxocara cati*, *Toxascaris leonina*)
- Treat and control adult and immature hookworm (*Ancylostoma tubaeforme*)
- Treat and control tapeworm (*Dipylidium caninum*, *Taenia* spp.)
- Prevent heartworm (*Dirofilaria immitis*)*.

Beef flavoured tablets.

INTRODUCTION

Controlling roundworm, hookworm, tapeworm and preventing heartworm* infections is essential for the good health of cats.

INDICATIONS**For control of gastrointestinal worms:**

MILBEMAX Tablets for Small Cats should be administered orally to kittens at 6, 8 and 12 weeks of age, then **every 3 months**. MILBEMAX Tablets for Cats should be administered to cats weighing over 2 kg. Nursing queens should be treated at the same time as their kittens. Adult cats should be treated **every 3 months**.

For heartworm* prevention (heartworm is not present in New Zealand):

MILBEMAX Tablets must be administered orally **every month**, preferably on the same date each month. If you miss the monthly interval, administer MILBEMAX immediately and resume your monthly dosing schedule.

When administering MILBEMAX Tablets, be certain that the entire dose is consumed. The cat should be watched for several minutes following dosing to be sure that all tablet(s) have been eaten. If all the medicine is not eaten, redose as soon as possible, with the full dose.

If worm problems persist, consult a veterinarian.

DIRECTIONS FOR USE**IMPORTANT**

Consult a veterinarian before use.

Before starting MILBEMAX, you should have your veterinarian confirm, by a simple test, that your cat does not have heartworm*.

The safety of MILBEMAX in heartworm* positive cats has not been established.

MILBEMAX Tablets should be given by mouth. The minimum dose is 2 mg milbemycin oxime and 5 mg praziquantel per kg bodyweight.

Bodyweight (kg)	MILBEMAX Tablets for Small Cats	MILBEMAX Tablets for Cats
0.5 – 1	1/2 tablet 	
>1 – 2	1 tablet 	
>2 – 4		1/2 tablet 
>4 – 8		1 tablet 

For cats >8 kg, a combination of tablets should be given, consistent with the recommended minimum dose.

MILBEMAX - ADDITIONAL INFORMATION

MILBEMAX Tablets provide a satisfactory margin of safety in cats when used according to label directions. This safe administration of MILBEMAX Tablets is supported in male and female cats of a minimum age of 6 weeks and a minimum weight of 0.5 kg and at a minimum interval of one week between doses. Satisfactory margins of safety have been demonstrated for praziquantel when administered during all reproductive phases. MILBEMAX Tablets can be used in breeding animals including toms and pregnant and lactating queens. Cats should be examined for existing heartworm* infection prior to starting treatment with MILBEMAX. Consideration should be given to treating infected cats to remove adult heartworms and microfilariae.*

Contact your veterinarian if any unusual signs develop following treatment with MILBEMAX Tablets.

This formulation is not suitable for use in dogs.

INTESTINAL PARASITES

Hookworms, roundworms and tapeworms are common intestinal parasites of cats in most parts of Australia.

Roundworm infections can be acquired by a kitten through the mother's milk, by ingestion of eggs in faeces, or by eating an infected small animal such as a mouse. In kittens, roundworms commonly cause general debilitation, which may be manifested by a rough and dry coat, general depression, failure to thrive, diarrhoea, abdominal distension and emaciation. Rarely, roundworm infections can also cause liver and lung disease. These large worms can fill the small intestine and interfere with the absorption of nutrients. Rarely, severe infections can be fatal due to intestinal obstruction caused by impacted worms.

Kittens and adult cats can acquire hookworm infections from infective larvae that accumulate in their environment, by ingestion and/or penetration through the skin. Hookworms are bloodsucking parasites of the small intestine. Hookworm infections can cause depression, inappetence, failure to thrive, marked anaemia and even death if blood loss is severe.

The most common tapeworm is *Dipylidium caninum*, transmitted by fleas. The life cycle is 2-3 weeks, and it is possible for the cat to become reinfected and shed worm segments between doses. Flea control is recommended.

HEARTWORM* (heartworm is not present in New Zealand)

Heartworm* is a serious and potentially fatal disease in cats. Much of the damage occurs before there are any outward signs of the disease, and these signs can be quite variable which can complicate diagnosis. Since therapeutic treatment for heartworm* is very risky, **prevention** is the key to protecting your cat. The disease is caused by a large worm

PA090383ALX 921846

which lives in the right side of the heart and adjacent blood vessels. A cat not on preventative medication can be infected with several worms. The adult worms damage blood vessels in the lungs which obstructs normal blood flow. This can result in an increased workload on the heart which can cause heart failure.

The disease is spread from animal to animal by mosquitoes. Female adult heartworm* discharge larval forms named microfilariae into the bloodstream of the infected animal. The mosquito becomes infected by sucking up these microfilariae as it takes a blood meal. During the next 2-3 weeks these microfilariae grow and moult twice inside the mosquito to reach the infective larval stage which enters the cat as the mosquito feeds again. In the cat it takes about 7 to 8 months for these larvae to grow and move to the heart.
