* Multivariable models adjusted are adjusted for the following covariates: age, sex, BMI, hypertension, CKD, COPD, diabetes and region of inclusion (Germany/Switzerland, Middle – East, Netherlands/Belgium, Russia, Southern – Europe United Kingdom). The models testing the association between a specific heart disease subtype and in-hospital mortality are also adjusted for the presence of other cardiac comorbidities (i.e. the model testing the association between heart failure and in-hospital mortality is adjusted for arrhythmia/conduction disorder, coronary artery disease and valvular disease).

* Multivariable models adjusted are adjusted for the following covariates: age, sex, BMI, hypertension, CKD, COPD, diabetes and region of inclusion (Germany/Switzerland, Middle – East, Netherlands/Belgium, Russia, Southern – Europe United Kingdom). The models testing the association between a specific heart disease subtype and in-hospital mortality are also adjusted for the presence of other cardiac comorbidities (i.e. the model testing the association between heart failure and in-hospital mortality is adjusted for arrhythmia/conduction disorder, coronary artery disease and valvular disease).
